RTC6701 CMOS 2.4GHz FM/FSK Transmitter

Product Description

The RTC6701 is a FM/FSK transmitter intended for application on 2.4GHz ISM band analog FM or digital FSK transmission. The chip includes a RF modulator, two channels of audio modulator and a power amplifier with up to +11.5dBm power output. The RF modulator block, which is frequency-synthesizer based with an integrated 2.4GHz VCO, generates the 2.4GHz FM signal modulated from stereo audio L(left)/R(left) signals. On-chip two audio modulators with stereo audio input signals provide the FM audio modulated signal at 6 MHz and 6.5MHz, respectively. Monaural application is also possible by turning off one of two audio modulators.

Transmission frequency can be set by internal register via SPI programming, or by selecting among 4 fixed channels using three dedicated pins. Output power of +1.5dBm or +11.5dBm can be configured via pins 28 and 29 to fit CE/FCC requirement easily. The device is available in a 32-pin QFN package.

Features

- 3.3V power supply
- 2.4GHz ISM band FM modulator
- FM/FSK transmitter operation
- Simple three digital pins setting 4 fixed channels to eliminate external micro-controller
- Output Power +1.5dBm or +11.5dBm, selected by pin connection
- FM sound carriers at 6 and 6.5MHz
- CMOS technology
- On-chip VCO and PLL
- Transmitter frequency programmability by SPI
- 32-pin leadless QFN package

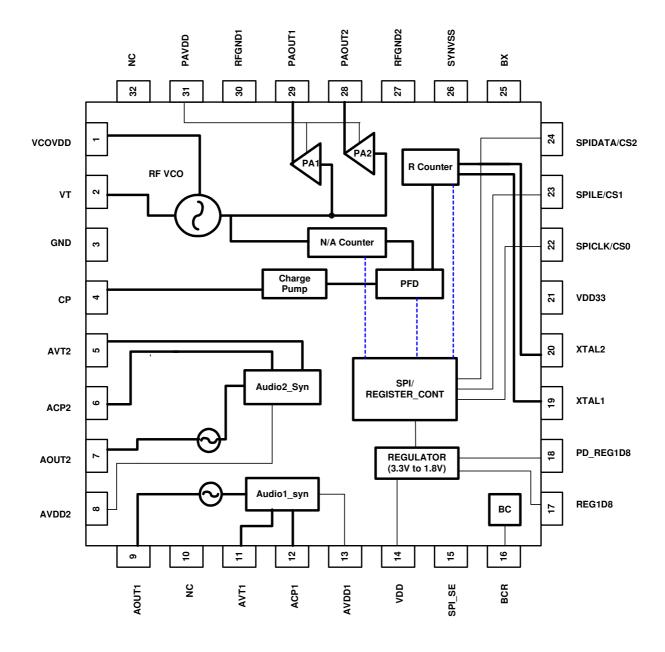

Application

- AV Sender
- FSK transmitter
- Baby Monitor
- Wireless Camera
- Wireless Audio
- Wireless Earphone

ELECTRICAL SPECIFICATIONS

(1) Absolute Maximum Ratings

SYMBOL	PARAMETER	Ratings	UNIT
Tstr	Storage Temperature Range	-65 to +150	°C
Totr	Operating Temperature Range	-40 to +85	°C
Vdd	Supply Voltage	-0.5 to +5	V
Vlog	Logic control signal	-0.5 to +5	V

The maximum rating must not be exceeded at any time. Do not operate the device under conditions outside the above ratings.

Note:

- 1.) On the rising edge of the clock, one bit of data is transferred into the shirt register.
- 2.) LE should be $*L^*$ when the data is transferred into the shirt register.

Channel Selection

There are two principle modes for channel selection.

SPI_SE (Pin 7)	High	Low
Mode	SPI Mode	Easy Channel Selection Mode

(1) Easy channel selection mode

When pin 15 (SPI_SE) is set at low (0V), the chip operates in easy channel selection mode. Operation frequency can be selected by the pins 25(BX), 24(CS2), 23(CS1) and 22(CS0). The selected channel frequencies are listed in the table below.

BX=0

Pin25 (BX) is pulled to low for normal ISM band, and operation frequency table show as following Table.

BX	SPI_SE	Pin22/Pin23/Pin24 CS0/CS1/CS2											
	_	011	101	110	111								
0	0	2414MHz	2432MHz	2450MHz	2468MHz								

BX=1

Reserved for alternative band selection

(2) SPI mode

When pin 15 (SPI_SE) is set at high (3.3V), the chip works as in the SPI mode and the pins 24(SPIDATA), 23(SPILE) and 22(SPICLK) are used for 'SPI' inputs for 3-wire programming interface. The BX is "don't care".
